

FOCUS TEARS PF

Formulated with 0.5% CMC for soothing relief, Focus Tears PF is delivered in preservative-free single-dose vials manufactured using advanced **blow-fill-seal (BFS)** technology.

WHY BLOW-FILL-SEAL (BFS) MATTERS

Blow-Fill-Seal is an advanced sterile manufacturing process where each plastic vial is formed, filled, and sealed in one continuous, automated cycle. The closed system helps maintain product sterility by removing human contact and environmental exposure, while also supporting sustainability through reduced material waste and the use of recyclable, lightweight plastic vials.

Extrusion → Blow → Fill → Seal → Demold

Focus Tears PF provides preservative-free hydration in sterile, single-use vials designed to support compliance and reduce the risk of contamination. Each dose delivers both safety and confidence, ensuring consistent care with every application.

Sterile & Preservative-Free

The container is created from sterile polymer, immediately filled, then sealed in one uninterrupted cycle with minimal human intervention. This design reduces opportunities for contamination compared with traditional multi-component lines.

Single-Dose Integrity

Each unit-dose vial is hermetically sealed to support container-closure integrity and consistent sterility assurance for a single use. Industry guidance specifically addresses BFS for sterile drug products.

Consistent, Precise Dosing

BFS technology delivers accurate fill volumes across every vial, supporting reliable dosing and quality patients and providers can trust.
